

TITLE

COPOLYMERIZATION OF CYCLIC ESTER OLIGOMERS

Abstract of the Disclosure

Chemically different cyclic ester oligomers can be copolymerized to form
5 copolyesters whose properties can be tailored by the choice of cyclic ester oligomers
used. The copolyesters formed are especially useful as encapsulants and as coatings.
In many instances the copolyesters, assuming they are not randomized in later
transesterification reactions, have unique microstructures related to the sequencing of
repeat units the their polymer chains.
